

Diamond Crown

Diamond crown, a newly developed hi-tech product, is featured by strong adhesion strength of diamond particle with drill bits and self-grinding during drilling operation, thus ensuring long performance.

It is 1.3 times higher in drilling speed and 3 times longer in service life than the conventional one made of high-grade natural diamond extracted in the granite and homstone zones:

Its manufacturing technique can be applied not only to the mining and machine-building industries but to stone dressing, magnet processing and other fields.

A Credible Guide to Foreign Trade

The DPRK Chamber of Commerce is active in its business as a credible guide to trade and economic exchange and cooperation.

The Chamber of Commerce concluded agreements on cooperation with the chambers of commerce and industry in Slovakia, Croatia, Pakistan and Zimbabwe between July 2011 and June 2012, which constituted a legal basis for constantly promoting its external activities with foreign countries.

It made a tangible contribution to intensifying trade and economic exchange and collaboration with different countries of the world for the last one year through exchange of delegations, trade information campaign at the international expositions and trade fairs and various other activities.

It, first of all, has placed special emphasis on collaboration through the exchange of delegations to promote trade and economic ties, thereby facilitating socio-economic development both in the DPRK and in relevant countries.

In November last year it invited two times to the DPRK the delegations of European 1T and clothing enterprises and organized working talks with its local trading partners, in which they agreed on consignment processing of various clothes, including 100 000 suits of men's clothes and 100 000 suits of

ordinary clothes a year. In October last year it invited French delegation of trade coordinating association that affiliates nine enterprises specializing in such fields as finance, metal, chemistry, city administration and hi-tech and organized business talks with its enterprises concerned in which they concluded agreements on mutual cooperation and also discussed the problems for their implementation.

In December last year and April this year it invited Chinese Jilin international joint venture association of minor enterprises and Zejiang delegation of enterprisers respectively and organized inspection tours to Unjong science district, Taephyong district and other areas and, on this basis, discussed the matter of investment possibilities for developing those districts into high-tech goods production zone and industrial park.

Besides, it invited delegations from Russian Far East, Czech, Switzerland and other countries and discussed the issues relating to transaction of plate glass and lubricants, medical-treatment tourism and the distribution of fish-breeding techniques.

The Chamber of Commerce was also active in sending delegations to expositions and fairs held in other countries.

It arranged preparations for dispatching the delegations to the 10th Chinese international equipment manufacturers' expo and the 11th Beijing international fair for process machines, building-materials machines and mining machines as well as meetings for exchange of technologies to conclude the agreements on exchange of equipment and technologies.

It had contacts with the Russian Chamber of Commerce and Industry and ensured that the Korea Jangsu Trading Corporation would export insam products to Russia and take part in the Moscow Health Food Exhibition, and established a well-knit system of advertising Kangso Mineral Water, insam products and other commodities of our country on the website of the Russian Chamber of Commerce and Industry on a regular basis.

The DPRK Chamber of Commerce will, in future, make a positive contribution to the development of the external economy of the country by further promoting exchange and collaboration with international and national chambers of commerce and industry and trade promotion organizations of other countries, proceeding from its mission.

Abundant Underground Resources and Policy of their Development

(A reporter of "Foreign Trade of the DPRK" had an interview with Kim Hung Ju, deputy director of a bureau of the DPRK Ministry of State Natural Resources Development.)

Reporter: I was told that in recent years the foreign investors' interest in natural resources of our country is on daily increase. I'd like to have a talk with you on some details of underground resources of the DPRK and its development policy.

Deputy director: As you know, our country is so rich in mineral resources that it is called a "mineral specimen room" of the world.

According to the geologists, Korean peninsula is endowed with a wealth of useful minerals that have been formed by magmatism and sedimentation caused by succession of big crustal movements.

Hundreds of kinds of minerals have been so far found in our country, of which useful minerals take large portion and they are in great deposits. There are lots of minerals needed for the development of the national economy, including iron and other ferrous metals, gold, silver, copper, lead, zinc, molybdenum and other nonferrous metals as well as magnesite, limestone, marble, etc.

Our country has also a wealth of rare earth, so called vitamin for industry, and fossil fuels such as anthracite, lignite, peat and ultraanthracite.

Indeed, our country is blessed with abundant underground resources and has a bright vista for their development, too.

Reporter: Would you please tell me about the DPRK policy on their development? Deputy director: The DPRK Law on Underground Resources was adopted by the Decree No.14 at the Fifth Session of the Ninth Supreme People's Assembly on April 8, 1993 and amended and supplemented afterwards.

The law is intended to establish rigid discipline and order in survey, development and use of underground resources so as to expedite socialist economic construction and improve the people's standard of living.

The state ensures that survey of underground resources is put on a Juche-oriented, modern and scientific basis to prospect necessary underground resources in targer quantities and at a faster rate.

Today the development of underground resources in our country is posed as a very important matter in putting the production of all sectors of the national economy on a normal track.

Institutions, enterprises and organizations can develop underground resources. They are obliged not only to make mining equipment large, modern and high-speed and diversify transportation but to give priority to tunnelling and introduce efficient mining methods to boost the mineral output.

Development of underground resources is subject to the approval of the state organ of deliberation of underground resources development.

Institutions, enterprises and organizations engaged in underground resources development shall ensure high efficiency of investment pursuant to the design of underground resources development.

They shall ensure rational organization of mining to excavate ore bodies that conform to mining criterion and standard of calculating deposits of underground resources. But the practices of digging out only high-grade and thick ore bodies in good condition to excavate are prohibited.

Abandoning of ore and coal mines and their pits should be subject to the approval of the state organ of deliberation of underground resources development.

Institutions, enterprises and organizations concerned should actively tap the resources of geotherm, underground water and mineral water necessary for the economic development and improvement of people's life.

The living environment of inhabitants and ecological environment of animals and plants, including land, resources and landscapes, should not be damaged in the course of their development,

The DPRK policy of underground resources development makes a tangible contribution to protection and development of underground resources to fully meet the increasing demands of the national economy for raw materials and fuel, and thus gives impetus to the building of a thriving socialist country.

A Giant Nonferrous Metal

The Komdok Mining Complex located in Komdok area with great deposits of lead and zinc ores is a leading nonferrous metal producer in the DPRK.

The complex composed of deep and upper sections has completed its pit structure with various sizes of shafts and equipped itself with up-to-date mining facilities.

It renovated several transporting shafts in the deep section and completed major chutes in the upper section, thereby laying a solid basis for cutting and transporting a great amount of ores.

Advanced technologies were introduced to put orecrushing and dressing on a modern basis and effect technical renovation of air-compressors, drilling jumbos, loaders and other equipment, thus further mechanizing pit work.

Producer

integral system of directing the overall production processes was perfected.

With a view to boosting ore production, the complex gives definite priority to prospecting, pit-building and tunnelling to push ahead with the

project of developing new mines with abundant deposit of high-grade ores in a prospective way.

The Komdok Mining Complex attracts interest of investors for its high efficiency of investment as it has concentrated one deposits.

Magnesia Clinker Industry Corporation

annually produce millions of tons of high-grade magnesite ores.

The mines have also large-sized, modern underground pits, thereby excavating and transporting ores in large quantities.

Magnesite ores are transported by rail to the Tanchon Magnesia Factory that has been updated under the far-reaching plan for technical renovation, where they are manufactured into quality magnesia clinker.

The corporation exports ordinary and high-grade magnesia clinker, light burnt magnesia, silica brick, atumina brick, unburnt mag-chrome brick, direct-fused mag-chrome brick and magnesia brick.

High-grade magnesia clinker (Mg: over 90%, SiO₂: under 0.5%) is a hot article in the world market.

Of late, the Tanchon Magnesia Factory has built a new processing line of by-products of magnesite to produce various kinds of building materials.

The Korea General Magenesia Clinker Industry Corporation presses on with its efforts for expanding and strengthening its production foundation, applying cutting-edge technology, upgrading quality of products and developing new products, while promoting trade with different countries of the world.

Progress in Marine Transport

It is one of the fundamental questions arising in the development of foreign trade to promote forwarding business.

The DPRK government, attaching great importance to the promotion of forwarding business, marine transport in particular, in the development of foreign trade, has channelled every effort into it.

The DPRK is endowed with geographical advantages for forwarding business as most of its territory is sea-bound.

Given the conditions, it has long since paid close attention to building numbers of cargo ships and organizing trade fleets for the development of marine transportation.

According to its long-range plan, trade fleets were organized with cargo ships like "Wangjaesan" of 14 000 tons and "Taedonggang" of 20 000 tons in the 1970s on the basis of its independent shipbuilding industry, thereafter incorporating large cargo ships such as "Hyoksin", "Rungnado", "Kangson" and "Songrim" and oil tankers into the fleets.

The number of cargo ships is increasing considerably with the growth of shipment. They are assigned in an effective way to ensure the prompt loading of cargoes in keeping with the quotations of the chartering markets, thus further

enhancing efficiency of transportation.

It is of primary importance in developing marine transport to equip trade ports with the up-to-date facilities and raise their traffic capacity.

The DPRK government is building trade ports on an extensive scale in favourable places on the East and West seas of Korea and upgrading the existing ones.

Chongjin, Nampho, Hungnam and other trade ports were further modernized to meet the requirements of the developing reality, with the result that accommodation capacity of cargoes was increased and the loading and unloading equipment like wharf cranes were updated to raise the level of mechanization of harbour operations, thus enhancing the handling capacity of cargoes.

In recent years the reconstruction of the Rajin Port was pressed on. And the Tanchon Port on the East Sea of Korea took a facelift with the completion of construction of northern and southern breakwaters stretching about 2 000 metres long together with an office building, hall of culture, light tower, depots and other necessary facilities. At present, its cargo traffic capacity amounts to millions of tons.

Its construction provides advantageous conditions for export of nonferrous metals and magnesia products manufactured in Komdok and Tanchon areas.

Trade ports of the DPRK, which are transit points of trade cargoes and the direct undertakers of storage and shipment of cargoes and services for trade ships and their crew, made radical improvement in their management and operation so as to establish an orderly control system in accordance with the international law of the sea. Well-regulated system of training the crew was established and modern repair bases were set up in various places.

Today the DPRK witnesses the increase in the number of corporations specializing in marine cargo transportation and chartering of trade ships, including the Korea Ocean Maritime Management Co., Ltd., Korea Ocean Shipping Agency, Korea General Foreign Transportation Corporation and Korea Chartering Corporation.

The firm material and technical foundations of the marine transport of cargoes in the DPRK will make a great contribution to the development of its foreign trade.

Korea Sonbak

Trading Corporation

The Korea Sonbak Trading Corporation, inaugurated in 1985, is specializing in shipbuilding, ship-repairing, ship-breaking and other categories of import and export businesses.

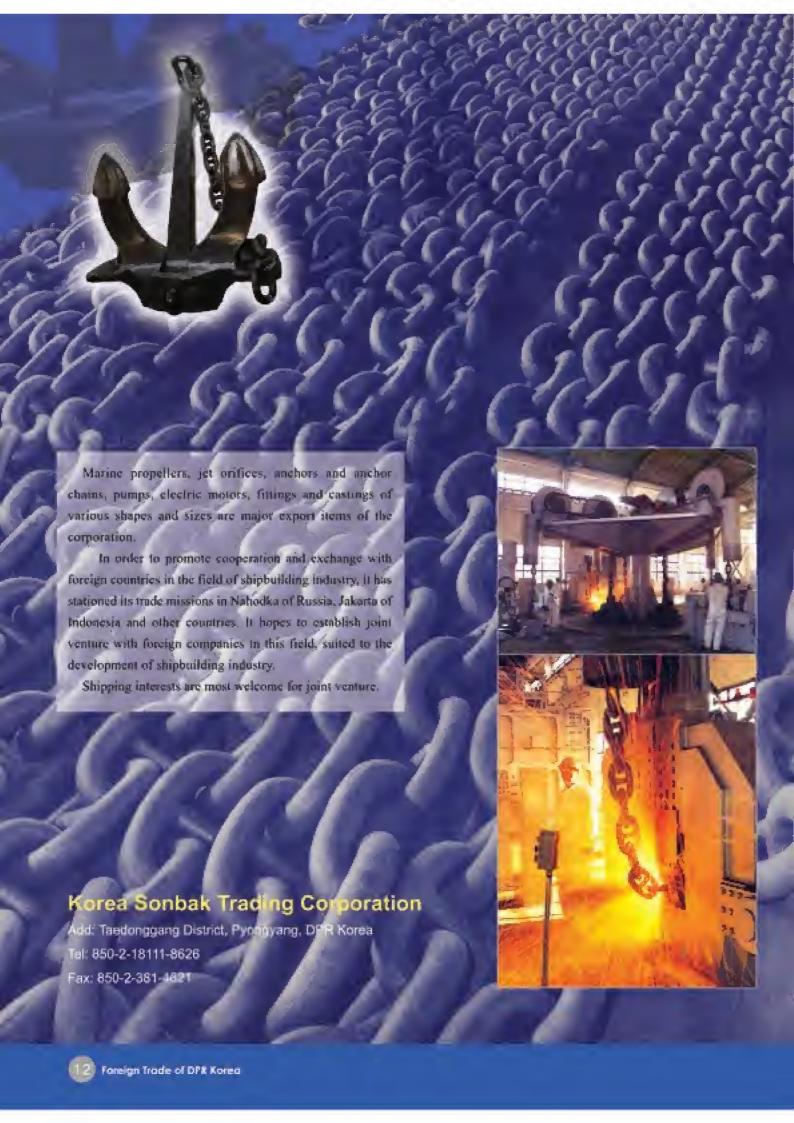

The corporation has under its control several shipyards and ship-repairing factories equipped with modern facilities on the East and West seas of Korea.

Along with this, it has marine engine factories, fittings factories, ship research institute, ship designing offices, floating and dry docks, so that it is in a position to build various kinds of cargo, cargo-passenger and refrigerator vessels, tug boats, barges and technical ships such as dredgers and floating cranes to meet the reguirements of the world trend of development of shipbuilding industry.

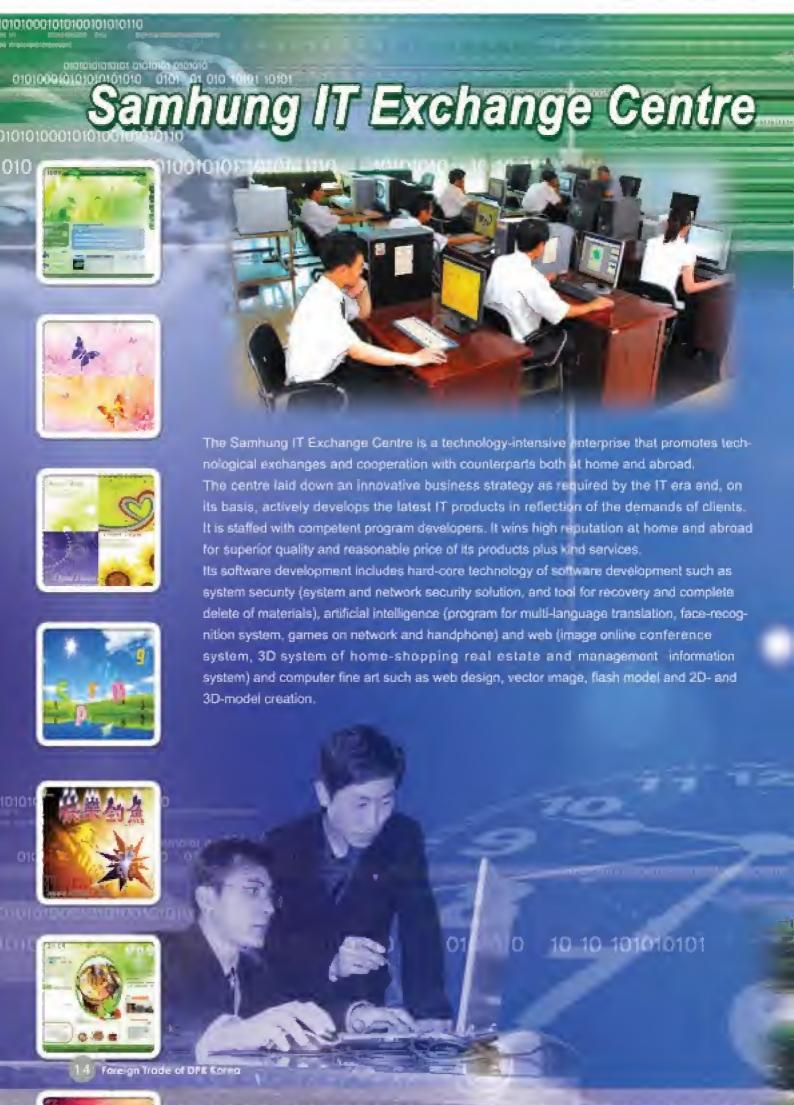

In recent years, the corporation exported many ships including 500-ton and 1 000-ton cargo vessels with loading platform on the deck and cargo-passenger ships to Russia, Indonesia and other Southeast Asian countries. These vessels are featured by rigid structure, perfect stability and manocuvrability and low consumption of fuel and excellent living conditions for the crew.

According to clients' order it is building various kinds of vessels including large cargo vessels and repair them.

Pyongyang Sangwon Cement

The Pyongyang Sangwon Cement J.V. Company is a renowned producer and exporter of cement and its

by-products in our country.

The company is undertaking its trade business, relying on a large-scale cement factory, a limestone mine, a gypsum mine, a refractory factory, a hydraulic power station and a coal mine, which supply sufficient amount of fuel, raw materials and electric power for cement production.

The modern cement factory is designed to control all its production processes, ranging from crushing, feeding and calcination to shipment at the central control room.

The limestone mine with a deposit of hundreds of millions of tons is furnished with up-to-date mining equipment like self-propelled drilling machines and large-sized lorries.

Ornamental gypsum planks for walls and ceilings and plaster works are winning popularity for their diversified patterns, superior quality and high craftsmanship.

The company makes every effort to develop collaboration and exchange with countries the world over to put equipment for cement production on a modern basis and boost production and export of various goods.

Introduced below are some of its export items.

- "Eagle" brand Portland cement

Physical properties:

Setting time: Initial from 45 minutes

Final within 10 hours

Compressive strength: 3 days 12-16MPa

28 days 27-34MPa

Chemical compositions (%)

CaO	SiO ₂	Al ₂ O ₃	Fe ₂ O ₂	MgO	SO ₂
59.5-61.5	20.5-22.5	5.7-6.5	2.5-4.5	3-5	2-3

Mt. Ryongak, People's Cultural

The Ryongaksan Pleasure Park, located in the area of Ryongaksan, Ryongsan and Ryongbong dongs, has been splendidly rebuilt into a cultural recreation ground for the people.

A curiously-shaped rocky peak, a fine display of beautiful blossoms in full bloom in spring, dense forests in summer and glorious tints of foliage in autumn—all these are in perfect harmony with one another. Hence, from olden times it has been called "Mi Kumgang in Pyongyang.

The mountain is, in the main, formed by such bed rocks as shale, siltstone and sandstone.

It is very steep for its deep valleys sweeping off in all directions and the naked rocks on its summit.

There are about 600 species of plants, mixed with needle-leaf and broadleaf trees including Clerodendron trichotomium, no trees and ze kova in the mountain, together with various species of protected animals and rare pirds.

Recreation Ground

Here also can be found Pobun Hermitage, Ryonggok Lecture Hall and other historic retics.

A sightseeing path has been well arranged and an artificial pond newty built. This makes visitors more delightful.

The pleasure park is provided with adequate conditions for sports games like football and valleyball, and folk games like swinging seesawing and game of you (a kind of traditional folk tames).

The Ryangeloan Pleasure Park is always rowded with workers youth and students and foreign Viscon.
